Introduction

- Lexical analyze script source
- Divide into logical blocks of characters
- Give special blocks a meaning
- flex (but only 2.5.4!)

Compiler Caches

How it works

Compiler Caches Serialization

- Serialization into SHM
- Direct execution from SHM (mostly)

- APC: active development, PHP license
- eAccelerator: GPL
- PHP Accelerator: updated, but not improved
- Turck MM Cache: abandoned
- XCache: new
- Zend Platform: commercial

KCacheGrind's Flat Profile and Call List

The screenshot shows a web browser window displaying the KCacheGrind profiling results. The browser address bar shows the URL: `/tmp/cachegrind.out.2208390584 [/home/httpd/ez/index.php] - KCacheGrind`. The browser interface includes a menu bar (File, View, Go, Settings, Help) and a toolbar with various navigation icons. The main content area is divided into two panels.

The left panel, titled "Flat Profile", displays a table with the following columns: Cum., Self, Called, and Function. The data is as follows:

Cum.	Self	Called	Function
99.999	10.766	(active)	{main}
